

White Label Hub — SOP

How this module works

Rebrand VELTRIX OS to resell as your own product — brand name, tagline, colors, a custom domain with a real DNS check, a pricing calculator, and a tracker for the clients you've resold to. Honest note: the logo is NOT set on this page — it lives in Settings, White Label tab (this page can display one, but has no field to change it). Colors/name/tagline you save here genuinely apply app-wide (page title, sidebar, theme colour) the moment you save.

SECTIONS

● Branding Wizard A 4-step flow — Branding, Colors, Domain, Pricing — each with a live preview on the right showing exactly how it will look once saved.	● Custom Domain Enter a domain/subdomain and run a real DNS CNAME check to confirm it points here correctly.
● Pricing Calculator A simple monthly/annual revenue projection from your price-per-client and client count.	● Client Tracker A record of who you have resold to — name, plan, price, status. Does not create real per-client branding (see the note next to the list itself).

STEP-BY-STEP WORKFLOW

- 1 Step 1: enter Brand Name, Tagline, Support Email and Footer Text.
- 2 Step 2: pick Primary and Accent colors, or use one of the preset pairs.
- 3 Step 3: enter a custom domain and run Test Domain to confirm the DNS CNAME is configured correctly.
- 4 Step 4: set your price per client and client count to see the projected revenue.
- 5 Click Save Configuration at any point — every field saves together, and the change is live across the whole app immediately.
- 6 The logo is set separately, in Settings, White Label tab — not here (see the note under the Live Preview).
- 7 Add clients you have resold to below, to keep a simple record — this does not change what any client actually sees.

CONNECTIONS

●  Main App Shell Brand name, tagline, colors and (if set) the logo genuinely render app-wide the moment you save — page title, sidebar, theme accent colour.	●  Settings Settings has its own White Label tab editing 5 of these same fields, including the logo. A known, disclosed overlap — not yet consolidated into one page.
